## Trigonometric Integrals

Trigonometric Integrals  Let us start with an integral that we know how to do,  J cos(x) sin <sup>5</sup> (x) dx  u=sin(x)  du=cos(x) dx  = \int_{0} u^{6} + c  = \int_{0} (\sin(x))^{1/6} + c  This integral is easy to do with a substitution because the presence of the cosine  Let us consider it without,  S sin <sup>5</sup> (x) dx  Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities,  S sin <sup>5</sup> (x) dx  = \int_{0} \sin^{6}(x) \dx  =
$J_{\cos(x)} \cdot \sin^{5}(x) dx$ $u = \sin(x)$ $du = \cos(x) dx$ $= \int u^{5} du$ $= \overline{u}  u^{7} + c$ $= \overline{u}  (\sin(x))^{1/2} + c$ This integral is easy to do with a substitution because the presence of the cosine let us consider it without, $J_{\sin^{5}(x)} dx$ Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities, $J_{\sin^{5}(x)} dx$ $= J_{\sin^{6}(x)} \sin(x) dx$ $= J_{\cos^{6}(x)} \cos(x) dx$ $= J_{\cos^{6}(x)} \cos(x) dx$ $= J_{\cos^{6}(x)} \cos(x) dx$ $= J_{\cos^{6}($
$J_{\cos(x)} \cdot \sin^{5}(x) dx$ $u = \sin(x)$ $du = \cos(x) dx$ $= \int u^{5} du$ $= \overline{u}  u^{7} + c$ $= \overline{u}  (\sin(x))^{1/2} + c$ This integral is easy to do with a substitution because the presence of the cosine let us consider it without, $J_{\sin^{5}(x)} dx$ Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities, $J_{\sin^{5}(x)} dx$ $= J_{\sin^{6}(x)} \sin(x) dx$ $= J_{\cos^{6}(x)} \cos(x) dx$ $= J_{\cos^{6}(x)} \cos(x) dx$ $= J_{\cos^{6}(x)} \cos(x) dx$ $= J_{\cos^{6}($
$\begin{array}{l} u = \sin(x) \\ du = \cos(x) dx \\ = \int u^5 du \\ = \overline{u} u^6 + c \\ = \overline{u} \left( \sin(x) \right)^6 + c \\ \end{array}$ This integral is easy to do with a substitution because the presence of the cosine Let us consider it without, $\int \sin^5(x) dx$ Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities, $\int \sin^5(x) dx$ $= \int \sin^6(x) \sin(x) dx$ $= \int (\sin^2(x))^2 \cdot \sin(x) dx$ $= \int (\sin^2(x))^2 \cdot \sin(x) dx$ $= \int (1-\cos^2(x))^2 \cdot \sin(x) dx$ $= \int (1-\cos^2(x))^2 \cdot \sin(x) dx$
du=cos(x) dx  = $\int u^5 du$ This integral is easy to do with a substitution because the presence of the cosine Let us consider it without, $\int \sin^5(x) dx$ Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities, $\int \sin^5(x) dx$ = $\int \sin^6(x) \sin(x) dx$ = $\int \sin^6(x) \sin(x) dx$ = $\int (\sin^2(x))^2 \cdot \sin(x) dx$ utilize $\sin^6(x) + \cos^2(x) = (-\infty^2(x))^2 \cdot \sin(x) dx$ = $\int (1-\cos^2(x))^2 \cdot \sin(x) dx$ utilize $\sin^6(x) + \cos^2(x) = (-\infty^2(x))^2 \cdot \sin(x) dx$
= \( \frac{1}{3} \text{ u'} + \cdot \)  = \( \text{i'} \text{ (sin(x))'} + \cdot \)  This integral is easy to do with a substitution because the presence of the cosine Let us consider it without, \( \text{Ssin}^5(x)  \dx \)  Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities, \( \text{Ssin}^5(x)  \dx \)  = \( \text{Ssin}^6(x)  \dx \)  = \( \text{Ssin}^
= to ut t c = to ut t c = to ut t c = to usin(sin(x)) t c  This integral is easy to do with a substitution because the presence of the cosine Let us consider it without,  Ssin <sup>5</sup> (x) dx  Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities,  Ssin <sup>5</sup> (x) dx = Ssin <sup>6</sup> (x) sin(x) dx = Ssin <sup>6</sup> (x) sin(x) dx = Ssin <sup>6</sup> (x) sin(x) dx  utilize sin <sup>6</sup> (x) t cos <sup>2</sup> (x) = 1 => sin <sup>2</sup> (x) = 1 - cos <sup>2</sup> (x) = Ssin <sup>2</sup> (x) = 1 - cos <sup>2</sup> (x)
This integral is easy to do with a substitution because the presence of the cosine Let us consider it without,  Ssin <sup>5</sup> (x) dx  Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities, $\int \sin^5(x) dx$ = $\int \sin^4(x) \sin(x) dx$ = $\int (\sin^2(x))^2 \cdot \sin(x) dx$ = $\int (1-\cos^2(x))^2 \cdot \sin(x) dx$ utilize $\sin^2(x) + \cos^2(x) = 1$ => $\sin^2(x) = 1 - \cos^2(x)$
This integral is easy to do with a substitution because the presence of the cosine Let us consider it without,  Ssin <sup>5</sup> (x) dx  Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities, $\int \sin^5(x) dx$ = $\int \sin^4(x) \sin(x) dx$ = $\int (\sin^2(x))^2 \cdot \sin(x) dx$ = $\int (\sin^2(x))^2 \cdot \sin(x) dx$ = $\int (1-\cos^2(x))^2 \cdot \sin(x) dx$
Let us consider it without,  Ssin <sup>5</sup> (x) dx  Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities,  Ssin <sup>5</sup> (x) dx  = Ssin <sup>4</sup> (x)·sin(x) dx  = S(sin <sup>2</sup> (x)) <sup>2</sup> ·sin(x) dx  utilize sin <sup>2</sup> (x) + cos <sup>2</sup> (x) = 1 => sin <sup>2</sup> (x) = 1-cos <sup>2</sup> (x)  = S(1-cos <sup>2</sup> (x)) <sup>2</sup> ·sin(x) dx
Let us consider it without,  Ssin <sup>5</sup> (x) dx  Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities,  Ssin <sup>5</sup> (x) dx  = Ssin <sup>4</sup> (x)·sin(x) dx  = S (sin <sup>2</sup> (x)) <sup>2</sup> ·sin(x) dx  = Usin <sup>2</sup> (x)) <sup>2</sup> ·sin(x) dx  = Usin <sup>2</sup> (x)) <sup>2</sup> ·sin(x) dx
Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities, $\int \sin^{5}(x) dx$ $= \int \sin^{4}(x) \cdot \sin(x) dx$ $= \int (\sin^{2}(x))^{2} \cdot \sin(x) dx$ $= \int (1-\cos^{2}(x))^{2} \cdot \sin(x) dx$ $= \int (1-\cos^{2}(x))^{2} \cdot \sin(x) dx$
Notice that we are unable to do the u-substitution without the cosine, so we may try to reintroduce it using identities, $\int \sin^5(x)  dx$ = $\int \sin^4(x) \cdot \sin(x)  dx$ = $\int (\sin^2(x))^2 \cdot \sin(x)  dx$ utilize $\sin^2(x) + \cos^2(x) = 1$ = $\int (1-\cos^2(x))^2 \cdot \sin(x)  dx$
try to reintroduce it using identities, $\int \sin^{5}(x) dx$ = $\int \sin^{4}(x) \cdot \sin(x) dx$ = $\int (\sin^{2}(x))^{2} \cdot \sin(x) dx$ utilize $\sin^{2}(x) + \cos^{2}(x) = 1$ = $\int (1-\cos^{2}(x))^{2} \cdot \sin(x) dx$
try to reintroduce it using identities, $\int \sin^{5}(x) dx$ = $\int \sin^{4}(x) \cdot \sin(x) dx$ = $\int (\sin^{2}(x))^{2} \cdot \sin(x) dx$ utilize $\sin^{2}(x) + \cos^{2}(x) = 1$ = $\int (1-\cos^{2}(x))^{2} \cdot \sin(x) dx$
= $\int \sin^4(x) \cdot \sin(x) dx$ = $\int (\sin^2(x))^2 \cdot \sin(x) dx$ utilize $\sin^2(x) + \cos^2(x) = 1$ => $\sin^2(x) = 1 - \cos^2(x)$ = $\int (1 - \cos^2(x))^2 \cdot \sin(x) dx$
$= \int (\sin^2(x))^2 \cdot \sin(x) dx \qquad \text{utilize } \sin^2(x) + \cos^2(x) = 1 \implies \sin^2(x) = 1 - \cos^2(x)$ $= \int (1 - \cos^2(x))^2 \cdot \sin(x) dx$
$= \int (1-\cos^2(x))^2 \cdot \sin(x) dx$
Now that we have both sine and cosine we can reintroduce the u-substition
Now that we have both sine and cosine use can reintroduce the usubstition
THE MESTIVE AND STREET OF THE MESTIVE AND STREET
$\int (1-\cos^2(x))^2 \cdot \sin(x) dx$
U= Cos(×)
du=-sin(x) dx
$=-\int_{0}^{\infty} (1-u^{2})^{2} du$
$=-\int 1-2u^2+u^4du$
$= -\left[u - \frac{2}{3}u^{3} + \frac{1}{5}u^{5}\right] + c$
$=-\cos(x)+\frac{2}{3}(\cos(x))^{3}-\frac{1}{5}(\cos(x))^{5}+c$
Notice that this rewriting and substitution worked because the exponent was or
one sine stays and the rest get changed. It is often good practice to separate t
odd function so that we have one sine (or cosine) and the rest cosine (or sine).
Recap: Sinn(x) cosm(x) dx
if n is odd: remove 1 sine, substitute the rest to cosine using sin (x) = 1-cos (x), use
substitution u=cos(x)
if m is odd: remove 1 cosine, substitute the rest to sine using cos (x) = 1 sin (x), use
substitution u=sin(x)
if n and m are odd: choose the one with the smallest exponent and follow that patt

Ex	ample:
1	$\int \sin^{4}(x) \cos^{3}(x) dx$ cos(x) is odd
1.	
	= $\int \sin^{6}(x) \cdot \cos^{2}(x) \cdot \cos(x) dx$ save one \$ replace the rest
	$= \int \sin^{6}(x) \cdot (1 - \sin^{2}(x)) \cdot \cos(x) dx$
	U= sin(x)
	du = cos(x) dx
	$= \int u^{1} (1 - u^{2}) \cdot du$
	= \( \frac{1}{2} \cdot 1
	$= \frac{1}{7}u^{7} - \frac{1}{9}u^{9} + c$
	$= \frac{1}{7} \left( \sin(x) \right)^{7} - \frac{1}{9} \left( \sin(x) \right)^{9} + C$
No	w we ask ourselves, what if m and n are even?
2.	Ssinz(x) cosz(x) dx
	$= \int \left[ \frac{1}{2} \left( 1 - \cos(2x) \right) \right] \cdot \left( \frac{1}{2} \cdot \left( 1 + \cos(2x) \right) \right] dx \qquad \text{half-angle} \qquad \sin^2 \Theta = \frac{1 - \cos(2\theta)}{2}$
	= 5 \ \ - c a c \ \ \ 2 \ \ \ \ \ \ \ \ \ \ \ \ \ \ \
	$= \frac{1}{4} \int \left[ -\left[ \frac{1}{2} \left( 1 + \cos \left( \frac{4x}{2} \right) \right) \right] dx \qquad \text{half angle } \cos^2 \theta = \frac{1 + \cos \left( \frac{2\theta}{2} \right)}{2}$
	$=\frac{1}{4}\int_{1}^{2}-\frac{1}{2}\cos(4x) dx$
	$=\frac{1}{4}\int_{\frac{1}{2}}^{\frac{1}{2}}\frac{1}{2}\cos(4x) dx$
	= 4[2x-8 sin(4x)]+c
	$=\frac{1}{8}x-\frac{1}{32}\sin(4x)+c$
alt	rernatively. $\int \sin^2(x) \cdot \cos^2(x) dx$
	$= \int (\sin(x) \cdot \cos(x))^2 dx \qquad double angle \sin \theta \cos \theta = \frac{1}{2} \sin(2\theta)$
	$=\int \left(\frac{1}{2}\sin(2x)\right)^2 dx$
	$=\frac{1}{4}\int \sin^2(2x) dx$
	$= \frac{1}{4} \int \frac{1}{2} (1 - \cos(4x)) dx$ half angle $\sin^2 \theta = \frac{1 - \cos(2\theta)}{2}$
	= 8 S1- cos(4x) dx
	= g [x - \frac{1}{2} \sin(4x)] +c
	$=\frac{1}{8}x-\frac{1}{32}\sin(4x)+c$
In	both of these examples we have sine and cosine of the same angle,
	at what if they are different?
3.	Scos (15x) cos (4x) dx
	$= \int_{\overline{z}} \left[ \cos(15x - 4x) + \cos(15x + 4x) \right] dx$
	$=\frac{1}{2}\int \cos(11x) + \cos(19x) dx$
	$= \frac{1}{2} \left[ \frac{1}{11} \sin(11x) + \frac{1}{14} \sin(19x) \right] + c$

## **Exit Ticket** Integration by Parts

**Integration by Parts** Let u(x) and v(x) be two differentiable functions. Integration by parts says

$$\int u dv = ux - \int v du$$

Evaluate the following integrals:

1. 
$$\int 8xe^{6x} dx$$

$$u = 8x \quad dv = e^{6x} dy$$

$$du = 8dw \quad v = \frac{1}{6} e^{6x}$$

$$du = 8dw \quad v = \frac{1}{6} e^{6x}$$

$$du = 4dw \quad v = 16 e^{6x}$$

$$du = 4dw \quad v = 16$$
